

## P135 Wander Detection Use

### P135E Call or Fall Badge

P135E Call or Fall Badge is set to “safelink” transmissions every 10 seconds.

The pager is “calibrated” by a simple walk around test to know the permitted area

As the wearer moves away from the pager the radio signal gets weaker and this is measured by the pager.

When it drops below the calibrated “safe area” value an alarm is raised

#### DISCLAIMER:

This is NOT a precise location system \*like GPS) but has proved most effective in domestic and residential homes in detecting when the wearer moves out of the building and beyond
